Quasi-Periodic Materials – Crystal Redefined / SHECHTMAN D.
(Technion, Haifa, Israel and ISU, Ames, Iowa, USA, Currently on Sabbatical at SNU.)

Crystallography has been one of the mature sciences. Over the years, the modern science of crystallography that started by experimenting with x-ray diffraction from crystals in 1912, has developed a major paradigm – that all crystals are ordered and periodic. Indeed, this was the basis for the definition of “crystal” in textbooks of crystallography and x-ray diffraction. Based upon a vast number of experimental data, constantly improving research tools, and deepening theoretical understanding of the structure of crystalline materials no revolution was anticipated in our understanding the atomic order of solids. However, such revolution did happen with the discovery of the Icosahedral phase, the first quasi-periodic crystal (QC) in 1982, and its announcement in 1984. QCs are ordered materials, but their atomic order is quasiperiodic rather than periodic, enabling formation of crystal symmetries, such as icosahedral symmetry, which cannot exist in periodic materials. The discovery created deep cracks in this paradigm, but the acceptance by the crystallographers' community of the new class of ordered crystals did not happen in one day. In fact it took almost a decade for QC order to be accepted by most crystallographers. The official stamp of approval came in a form of a new definition of “Crystal” by the International Union of Crystallographers. The paradigm that all crystals are periodic has thus been changed. It is clear now that although most crystals are ordered and periodic, a good number of them are ordered and quasi-periodic. While believers and nonbelievers were debating, a large volume of experimental and theoretical studies was published, a result of a relentless effort of many groups around the world. Quasi-periodic materials have developed into an exciting interdisciplinary science. This talk will outline the discovery of QCs and describe the important role of electron microscopy as an enabling discovery tool.

장소: 301호

좌장: 여인환 연세대

The Nobel Prize and the Future of Science / GIAEVER Ivar(Norwegian Institute of Technology, Rensselaer Polytechnic Institute.)

In the year 2001 the Swedish people celebrated the 100 years anniversary of the Nobel Prize. During this period science has changed remarkably. In this talk I will explain how the Nobel Prize came about and give my personal views about where I think science is headed in the future. It is my belief that most fundamental laws of science are known, but that scientists are still needed to sort out details and to make new inventions.

노벨상의 지난 100 여 년을 돌아보는 Giaever 교수님의 기조강연은 연세대 물리학과의 지원으로 이루어졌습니다. 기조강연에 앞서 황정남 연세대 명예교수님께서 한국물리학 100 주년 (근대 물리학의 도입)에 대해 15분간 발제강연을 하시고, Giaever 교수님께서 45분간 기조강연을 하실 것입니다.
